Botox Injections for Anal Fissure Or Anal Pain

Botox Injections

Botulinum A toxin (Botox) injections is an effective treatment for pain from muscle spasm in many parts of the body. It is also effective for treating Anal Fissure or Anal Pain. Most patients have at least some relief in their pain after treatment with Botox. In about one half (50%) of patients the pain goes away completely. It usually takes about 1 to 2 weeks to start feeling relief. Maximum relief is generally seen around 4 weeks after injection and lasts for about six months.

How are Botox Injections given?

- We usually give 4 or 5 injections, each containing 80 to 100 IU of Botox. The doctor injects this small amount of liquid (1cc) into the pelvic muscles. You will get a needle stick with each injection.
- The entire procedure takes about 30 minutes. The injection time usually takes less than 5 minutes.
- You will receive IV sedation before the procedure to reduce the pain.

Pre-procedure Instructions

- Make arrangements for someone to drive you home after the procedure.
- Consider making arrangements for someone to help you out for a day or two after you leave the hospital.
- Do not eat or drink for six hours before the procedure.
Possible side effects

- Most patients have a small amount of anal bleeding for up to 24 hours after the injection.
- About 10% of patients have some mild flu-like symptoms (body aches, headaches) for 48 hours after the injection.
- About 5% of patients notice an increase in passing gas. These symptoms resolve over time.

Post-procedure Instructions

- Continue with your bowel and biofeedback program. Your doctor and nurse team will adjust your pain medications and bowel regimen according to your response.
