

Tell your doctor if you are pregnant or breastfeeding.

You have scheduled an I-123-MIBG TM study. This study uses a small amount of radioactive material. The level of radioactivity used is extremely low and has no side effects.

How do I prepare for my study?

Take 1 drop of SSKI (super saturated potassium iodine) or Lugol's[®] solution 3 times a day starting 1 day before the study. This is used to keep your thyroid gland from taking up any radioactive material. Your doctor will give you a prescription that may be filled at a pharmacy. Continue taking 3 days after the study.

Tell your doctor if you are taking any of the following medicines because interfere with the test:

- Labetolol[®]
- Reserpine[®]
- Calcium channel blockers
- Tricyclic antidepressants
- Decongestants (over the counter, such as pseudoephedrine, Phenylpropanolamine, and phenylephrine)
- Cocaine

What will happen during my study?

This is a 3 part study:

Part 1:

We will inject a small amount of radioactive material into your vein.

Part 2 (24 hours later):

We will position you on an imaging table, under a special detector called a gamma camera. The camera will be close to the part of your body being imaged. The camera does not produce any radiation and will not cause any pain or discomfort.

You may also receive a CT scan as part of the imaging procedure to help your doctors read the study

Part 3 (48 hours from injection):

We will repeat part 2. This will take about 1 hour.
