

Tell your doctor if you are pregnant or breastfeeding.

You have scheduled a White Blood Cell study. This study uses a small amount of radioactive material. The level of radioactivity used is extremely low and has no side effects.

What happens during the study?

This is a 3-part study. :

Part 1:

- We will draw your blood. Your white blood cells are then tagged with a small amount of radioactive material.

Part 2 (2 hours later):

- We inject your tagged white blood cells into a vein in your arm.

Part 3 (1-4 hours after injection):

- We will take painless images for approximately 1-2 hours.
- We will position you on an imaging table, under a special detector called a gamma camera. The camera will be close to the part of your body being imaged. The camera does not produce any radiation and will not cause any pain or discomfort.
- You may also receive a CT scan as part of this exam to aid the physicians in interpreting your images.
- We may also need images 24 hours after injection.
