THE RESEARCH CENTER

The Mobility Research Center uses expertise from a number of disciplines such as geriatrics, biomechanics, exercise physiology, nursing, physical and occupational therapy, and neuropsychology to examine the mechanisms underlying mobility problems and to develop interventions to address these problems. Patients from the Mobility Enhancement Clinic are often referred to the Mobility Research Center for participation in innovative interventions.

Both the clinic and research center are directed by Neil Alexander M.D., who specializes in geriatrics at the University of Michigan Geriatrics Center.
