What are my care Instructions?

Dressing changes

• Change dressing every 1-2 days or after taking a shower.
• Wash your hands.
• Remove the old dressing and clean around the tube daily with a clean, single use washcloth, using mild liquid soap and water.
• Rinse well.
• Pat dry.
• Apply new, clean dressing, be careful to position tube so that it does not kink.

Follow-up care

• Tubes are usually changed every 4-6 weeks.
• If for some reason you are not called with a follow-up appointment, please call our office at 734-615-0189 to schedule your tube change.

Flushing

Some tubes need to be flushed daily.
• To flush your PTC tube use 10cc syringe filled with normal saline.
• Connect syringe to end of tube.
• Push 10cc of normal saline into the tube as fast as possible without causing discomfort.
• Do not pull back on syringe.
How will I care for myself at home?

Showering and bathing

- Avoid hot tubs and swimming
- Do not allow the puncture site to be under water as this may lead to the development of infection.

Showering during the first 14 days after placement of the tube

- Before taking a shower, cover the dressing with a double layer of plastic wrap (also called Saran Wrap) and tape edges to skin.
- After the shower, remove plastic wrap and change dressing.

Showering after the site is healed or after 2 weeks

- You may shower without the dressing or plastic wrap using soap and water. Rinse well. Pat the area dry and apply a clean, dry, dressing.
- You can sit in a bathtub if you prefer, but the water level must be well below where the tube enters your skin (puncture site).

Activity

- Avoid any activity that causes a pulling sensation or pain around the tube, or kinking of the tube.
- Avoid activities such as bending forward or lifting heavy objects as this may result in bile leaking around the tube.

Diet

- You can eat your normal diet. If your stomach is upset, try bland, low-fat foods like plain rice, toast and yogurt
- Drink plenty of fluids (unless your doctor tells you not to).
Medications

- You can take your normal prescription medicines as your doctor has instructed you to do.
- If you are not taking a prescription pain medicine, ask your doctor if you can take an over-the-counter medicine for your pain.

The valve should be in the open position to allow proper drainage from tube into drainage bag.

When should I call for help?

Call Vascular and Interventional Radiology at 734-936-4500, option 1, 5 between 8 a.m. and 5 p.m. Monday through Friday if you have any of the following:

- Fever (greater than 100.6°F)
- Chills
- Dark urine and light colored stool
- Leakage of bile around the tube and onto your skin requiring several dressing changes in a day.
- Jaundice (yellow skin)
- Difficulty flushing the tube or a leak around the tube when flushing.
If any of the above happens, attach a drainage bag to the tube and call Vascular and Interventional Radiology.

If the tube falls out it must be replaced within 12-24 hours. Cover the hole in the skin with gauze pads and tape and call Interventional Radiology.

After hours you can call the Interventional Radiologist on call at 734-936-6267.

Call 911 anytime you think you need emergency care. For example, you need to call if:

- You have shortness of breath
- You have chest pains
- You passed out (lost consciousness)
